

Amendments to the Specification:

Please amend the abstract as follows:

A generic mobile synchronization framework facilitates synchronization of data objects between platforms by comparing these data objects from one platform with a replica of data objects on the other platform. Generic messages identifying the differences in the data objects are converted into an adapted ~~adaptive~~ message suitable for use by the underlying synchronization hardware and sent to the ~~the~~ ^{[[eh]]} platform needing synchronization. That platform converts ~~the~~ adapted message^{[[s]]} ~~them~~ to the corresponding original generic messages, and executes them, synchronizing the data objects in that platform with the originating platform.
